Spring Boot Trick

^ What is Spring Boot

- Imagine You own a restaurant
to run the restaurant you need

- ① Chef
- ② Cashier
- ③ Delivery Boy
- ④ Cleaner

You don't hire them every day yourself
You simply tell the Manager
"I need a chef"

← The Manager find that chef for you
Spring = Manager.

* Spring Manage all the object in your App)

* Bean

every emp in the restaurant is a Bean
eg

- Chef = Bean
- Cashier = Bean
- Delivery Boy = Bean

Bean - A Java object managed by Spring

A Dependency Injection (DI)

The chef & stove

The chef needs a stove

Does The chef ~~33~~ buy The stove?

No X

The Manager give The stove To The chef
This is called Dependency Injection

DI = Don't create, inject

Spring provide The required object automatically

A IoC (Inversion of control)

Without Spring

~~Cor = co~~

Cor cor = new CorC();

You create The object.

With Spring

. You don't create The object.
Spring create and Manage it.

IoC - Spring ~~create~~ control The object not you

★ What is Spring Boot

earlier, developer had to configure everything manually

xml configuration

- server setup
- library setup
- project configuration

Spring Boot says:

"~~fewer~~ it i will configure everything automatically."

Spring Boot = Spring + Auto configuration

★ Difference betn spring framework & spring boot

Spring framework	Spring Boot
① A Java framework for building application	an extension of Spring that makes development faster & easier
② require a lot of manual configuration	uses Auto configuration
③ external Tomcat server is usually needed	come with an embedded Tomcat server
④ more XML / Java configuration	minimal configuration

Trick

Spring : Manual car

you have to:

- start the engine
- change gears
- control everything yourself

Spring Book = Automatic car

Just

- Start The car
- drive

everything handled Automatically.
